SETUP GUIDE

Set up your own LearnerBot

Set goals, log what you do, and get an AI coach that helps you stay on track. You set it up once, on your computer first and then on your phone. It takes about 15 minutes.

WHAT YOU ARE BUILDING

- Your goals live in **a Google Sheet in your own Google account**. Nobody else can see them, including the person who sent you this guide.
- A small script inside that sheet connects the AI coach (a free **Groq** account) and publishes your private app address.
- The **LearnerBot website** is the screen you use on your computer and phone. It has no accounts of its own; it only talks to your sheet, and only with your secret token.

WHAT YOU NEED

- A Google account (a Gmail address works).
- A computer with a web browser (Chrome, Edge, Firefox or Safari). Part 1 is done here.
- Your phone, for Part 2.
- A free Groq account. You create it in step 2.

YOUR LINKS

1. The template sheet (you make your own copy of it in step 1):

https://docs.google.com/spreadsheets/d/1m1vy7L19w-Dmt8s2Wd-h3tM8gdfzpk-0Dqm-E_t3DpY/copy

2. The LearnerBot website:

https://optimusprimarch.github.io/learnerbot/

3. Where you get a free Groq key:

https://console.groq.com/keys

Part 1 · On your computer

1 Make your own copy of the sheet

1. Open the template link above in your browser, signed in to your Google account.
2. Google shows a **Make a copy** box. Click **Make a copy**.
3. Your copy opens in a new tab and is saved in your Google Drive. **Use your copy from now on**, and don't type anything into the original template.

> **CHECKPOINT** You see a spreadsheet and, after a few seconds, a menu called **LearnerBot** next to **Help**. If the menu is missing, reload the page and wait a moment.

2 Get a free Groq key

1. Go to **console.groq.com/keys** and sign up or log in. Signing in with Google works.
2. Click **Create API Key**, name it `LearnerBot`, and submit.
3. **Copy the key now.** It starts with `gsk_`, and Groq only shows it once. Keep that tab open until step 3 is done.

3 Give your copy the key

1. In your copy of the sheet, choose **LearnerBot → 1. Set Groq API key…**
2. The first time, Google asks for permission. Click **Continue** and pick your account. You will see "*Google hasn't verified this app.*" That is expected, because the script is your own copy. Click **Advanced**, then **Go to … (unsafe)**, then **Allow**.
3. If nothing more happens after you allow it, choose **LearnerBot → 1. Set Groq API key…** again.
4. Paste your key and click **OK**.

> **CHECKPOINT** A box says **Saved**. The key is stored privately inside your script. It is not written in the sheet and is never sent to the website.

4 Publish your copy as a web app

1. In your copy, choose **Extensions → Apps Script**. A new tab opens.
2. Click the blue **Deploy** button (top right), then **New deployment**.
3. Click the gear icon next to *Select type* and choose **Web app**.
4. Check that it says **Execute as: Me** and **Who has access: Anyone**, then click **Deploy**. If Google asks for permission again, allow it as in step 3.
5. Google shows a **Web app URL** that ends in `/exec`. **Copy it** (select it and press Ctrl+C, or Cmd+C on a Mac).

> **GOOD TO KNOW** "Anyone" only means the address can be reached. Every request also needs your secret token from step 5, and is refused without it. You can find this URL again any time under **Deploy → Manage deployments**. Use **only** the address from here; addresses from other places won't work.

5 Get your access token

1. Go back to your sheet tab and choose **LearnerBot → 2. Show connection info**.
2. Click inside the **Access token** box, press **Ctrl+A** and then **Ctrl+C** (Cmd on a Mac) to copy it. The Copy button doesn't always work, so this is the reliable way.

> **TREAT IT LIKE A PASSWORD** The token is 64 letters and numbers. Anyone who has both your URL and your token can read and change your goals.

6 Connect the website

1. Open the LearnerBot website (your link 2) and click the ⚙ button.
2. Paste the **Web app URL** (step 4) into the first box and the **access token** (step 5) into the second. Use **Show** if you want to check what you pasted.
3. Click **Save & test**.

> **CHECKPOINT** The box says **Connected** and you land on an empty dashboard. If you see an error instead, check the troubleshooting table at the end.

7 Try it out

1. Type a goal into **Add Goal** and press **Add**. Add a task under it, then tick it off.
2. Press **Run daily**. The AI coach picks today's focus. It takes 10 to 20 seconds.
3. Open the chat bar at the bottom ("Talk to your dashboard") and try something like "*add a goal to learn SQL*".

Make it yours. When you add or edit a goal you can give it a **due date** (the ✎ button edits any goal), and when you log what you did you can pick how long it took, in 15-minute steps. Both are optional, and your coach reads them. Completing or removing something shows an **Undo** bar for five seconds. Open ⚙ → **Coach voice** to choose how your coach sounds, from gentle to drill sergeant, or write your own in plain words, and ⚙ → **Look** to pick a theme (including your own two colors), accent color and font. You can change both any time.

Optional: email updates. Open ⚙ → **Email updates** to choose a daily focus, a weekly review, and an evening nudge, and when they arrive. Press **Save email settings**, then **Send me a test email** to check it reaches you. Nothing is sent unless you turn it on, and emails go only to your own Google address.

Part 2 · Connect your phone

Do this after Part 1 works on your computer. You don't copy anything onto your phone: the computer emails you a one-time link.

1 Send yourself the link

1. On your computer, open the LearnerBot website and click ⚙.
2. Open **Add your phone** and click **Email me a connection link**.

> **CHECKPOINT** It says **Sent to** and your address. The email comes from your own Google account and goes only to you.

2 Open it on your phone

1. On your phone, open that email (the inbox of the same Google account).
2. Tap **Connect this phone**. **Do it within 10 minutes**: the link works once and then expires.
3. LearnerBot opens in your phone's browser and connects itself.

> **CHECKPOINT** You see your dashboard, with the same goals as on your computer.

3 Keep it handy

- **Android:** open the browser menu and choose **Install app** or **Add to Home screen**. It stays connected.
- **iPhone:** use LearnerBot in **Safari** and bookmark it. A shortcut added to the Home Screen keeps its own separate storage and would start out disconnected, and an emailed link opens in Safari, not in that shortcut.

4 More phones, or a lost phone

- **Another phone:** repeat step 1 and 2 for each one (up to 10).
- **Lost or replaced phone:** on your computer open ⚙ → **Add your phone** and click **Disconnect** next to it. It stops working straight away. Each phone has its own access, so disconnecting one doesn't affect the others or your computer.
- **Link says expired or already used:** that's normal after 10 minutes or one use. Make a new link from your computer.

Good to know

- **Privacy.** Your goals, journal and chat are stored in your own sheet. The website keeps nothing about you.
- **Start over or disconnect everything.** In your sheet, choose **LearnerBot → Reset access token**. This makes a new token and disconnects every phone. Then repeat steps 5 and 6 of Part 1.
- **Speed.** Everyday actions take about one to three seconds. AI actions (daily focus, weekly review, chat) take 10 to 20 seconds.
- **Limits.** To protect your free Groq quota, the AI is limited to 40 requests an hour.
- **Updates.** The website updates for everyone automatically. When your sheet's script falls behind, LearnerBot shows a note with an **Update now** button. Press it and wait a few seconds; nothing is lost. It checks the new version before installing it, and ⚙ can take you back to the earlier one.

If something goes wrong

WHAT YOU SEE	WHAT TO DO
No **LearnerBot** menu in your sheet	Reload the page and wait about 10 seconds. Make sure you're in **your copy**, not the original template.
"Google hasn't verified this app"	Expected. Click **Advanced**, then **Go to … (unsafe)**, then **Allow**. The script is your own copy.
"Could not reach your backend"	The URL is wrong or the deployment isn't set to **Who has access: Anyone**. In the Apps Script tab choose **Deploy → Manage deployments**, copy the Web app URL again, and check that setting.
"Rejected the token" or "Wrong access token"	The URL and the token must come from the **same sheet**. Do step 5 again, copy with Ctrl+A and Ctrl+C, and use **Show** to check what you pasted.
"No Groq API key yet", or the AI buttons fail	In your sheet choose **LearnerBot → 1. Set Groq API key…** and paste the key again. If it still fails, wait a minute: Groq's free plan has limits.
"A newer version is available", or "your sheet's script is out of date"	Press **Update now** and wait a few seconds. If it says it could not finish, wait a minute and try again. The same message has an **update by hand** link with short steps.
Phone link "expired or already used"	Make a new link from your computer (⚙ → **Add your phone**) and open it within 10 minutes.
Want to start from scratch	Make a new copy of the template and repeat Part 1. Your first copy keeps your old data.

The same steps are on the website at **optimusprimarch.github.io/learnerbot/setup.html**.
